

To structure the membership of your digital warehouse receipt marketplace while keeping regulations low, you need a **B2B Closed-Loop Participant Model**.

Since your platform interacts with a government-backed entity (the WRSC Central Registry) and handles large financial settlements through a partner bank, you cannot allow random public sign-ups. Instead, you must structure members into strict, verified tiers with distinct platform rights.

Here is the organizational framework to build into your system, categorized by participant tiers, verification protocols, and fee structures.

1. The Membership Tier Architecture

You should divide your users into four primary classes. Each class gets a tailored dashboard UI and restricted access to the API endpoints.

Tier 1: The Producers (Sellers)

- **Who they are:** Individual commercial farmers, agricultural cooperatives, and aggregators.
- **Platform Rights:** Can view their e-WR balances synced from the Central Registry; can initiate Spot Listings, Auctions, or Forward Contracts; can request pre-sale bank financing.
- **System Limitation:** Cannot buy commodities or place bids on auctions.

Tier 2: The Off-Takers (Buyers)

- **Who they are:** Millers, animal feed manufacturers, tea/coffee packers, and international exporters.
- **Platform Rights:** Can browse spot listings, place binding bids in live auctions, lock forward contracts, and fund transaction escrows.
- **System Limitation:** Cannot issue warehouse receipts or request farmer-inventory financing.

Tier 3: The Enablers (Warehouse Operators)

- **Who they are:** Managers of WRSC-certified storage hubs (e.g., NCPB silos, private cold-chain facilities).
- **Platform Rights:** Read-only access to verify digital title transfers when a buyer comes to collect physical stock; capability to co-sign quality logs via API.
- **System Limitation:** Completely blocked from trading or participating in financial flows.

Tier 4: The Financiers (Underwriters)

- **Who they are:** Partner commercial banks, agricultural SACCOs, and licensed FinTech lenders.
- **Platform Rights:** Access to the credit-risk dashboard showing unencumbered e-WRs; ability to deploy liquidity directly into the escrow pipeline; ability to place and lift digital liens.

2. Onboarding & Legal Compliance Workflow

To maintain your "regulatory-light" status, you must offload the legal compliance burden onto

your members and partners.

Step 1: Corporate KYC & KYB (Know Your Business)

Instead of building an expensive compliance department, integrate a third-party verification API (like Smile ID or similar regional business registries) into your signup flow.

- **For Buyers/Sellers:** They must upload company registration certificates, tax compliance certificates (PIN/TIN), and IDs of company directors.
- **For Warehouses:** They must upload their active **WRSC Certification License** and evidence of structural insurance.

Step 2: The Tripartite Master User Agreement

Every member must digitally sign a binding master agreement before their account is activated. This contract must contain three protective legal pillars:

1. **Submission to the WRSC:** Members agree that the WRSC Central Registry is the final arbitrating ledger for commodity ownership.
2. **Consent to Bank Escrow:** Buyers and sellers explicitly agree that all financial clearing happens within the partner bank, completely absolving your platform of cash liabilities.
3. **Arbitration Clause:** Any quality disputes upon physical pickup are handled between the buyer and the certified warehouse operator under the WRS Act, protecting your software platform from litigation.

3. Monetization & Fee Structures

To keep incentives aligned, avoid monthly subscription fees at the beginning. Instead, use a **Transaction-Based Success Model** built directly into the money split-payout flow.

1. **Platform Marketplace Fee (The Commission):** Charge a **1.5% to 2% commission** on the gross value of every successfully settled transaction (Spot, Auction, or Forward). This fee is automatically routed to your corporate wallet by the bank escrow API during final settlement.

2. **Escrow Processing Fee:** Charge a small flat or percentage fee (e.g., **0.5%**) passed directly to the buyer to cover the commercial bank's cost of maintaining the secure escrow node.
3. **Financing Origin Fee:** When a bank issues an advance loan against an e-WR to a farmer, your platform charges the bank a **0.5% tech-facilitation fee** out of the interest they earn, as you provided the verified data pipe that secured their loan.

4. Platform Trust & Governance (The Rating System)

Because you do not operate a central clearinghouse to guarantee trades, you must enforce discipline through a digital **B2B Reputation Score**.

- **Buyer Performance Score:** If a buyer locks a forward contract or wins an auction and fails to fund the bank escrow within the designated time frame, the platform automatically docks their score, restricts their maximum bidding limits, or suspends their membership.
- **Seller Reliability Flag:** Connects directly to the rejection rates of their deposits at the warehouse gate, ensuring large buyers can prioritize bidding on lots held by highly rated cooperatives.

By structuring membership this way, your platform becomes an elite, self-governing B2B club where commercial entities trade safely, and you collect transaction revenues without taking on systemic risk.
